

Release Summary: SilkSync

Product Name: SilkSync

Team Name: BevGo!

Date: March 5, 2026

1. Key User Stories and Acceptance Criteria

These stories serve as the guide for the final acceptance test of the current release.

Sprint 1: Core Foundation & Mapping

- **User Story 1.1: Account Core**
 - **Description:** As a traveler, I want to create an account or log in using email so that my map offsets, currency preferences, and past travel routes are synced across devices.
 - **Acceptance Criteria:** User can successfully register and log in; user data (preferences and routes) persists across different devices after logging in.
- **User Story 1.2: Dual-Map Bridge**
 - **Description:** As a traveler, I want my map to switch to Amap when I enter China to ensure navigation accuracy and remain accurate when crossing borders.
 - **Acceptance Criteria:** The application detects the user's entry into China and automatically switches the provider to Amap; map coordinates remain accurate without "offset" during the transition.
- **User Story 1.3: FX Engine**
 - **Description:** As a planner, I want to input USD and see CNY conversions for accurate budget planning.
 - **Acceptance Criteria:** User can input a USD value and receive a real-time conversion to CNY within the budget interface.

Sprint 2: Budgeting & Suggestions

- **User Story 2.1: Cost Breakdown**
 - **Description:** As a user, I want to see a breakdown of travel costs so that I can understand where my money is being spent.
 - **Acceptance Criteria:** The interface displays a categorized list of expenses (e.g., transport, food, lodging) contributing to the total trip cost.
- **User Story 2.2: Route Suggester**
 - **Description:** As a budget traveler, I want the app to suggest routes based on my total funds so that I can choose an affordable destination.

- **Acceptance Criteria:** Given a total budget input, the app returns a list of travel destinations and routes that fall within that financial limit.

Sprint 3: HSR Search & Social Integration

- **User Story 3.1: HSR Train Search**
 - **Description:** As a traveler, I want to search for trains so that I can view departure times and current ticket pricing to arrive at my destination city.
 - **Acceptance Criteria:** Searching for a train number or route displays accurate, current departure times and pricing information.
- **User Story 3.2: Train Check-In**
 - **Description:** As a solo traveler on a long-distance train trip, I want to "Check-In" to my train number so that I can find others on the same journey.
 - **Acceptance Criteria:** User can select a specific train and see a list of other "checked-in" users on that same journey.
- **User Story 3.3: Social Intent**
 - **Description:** As a user, I want to set my "Social Intent" (e.g., "Looking for meal buddy") to find like-minded companions.
 - **Acceptance Criteria:** User can update their profile with a specific intent, which then becomes visible to other travelers on the same route.

Sprint 4: Final Coordination & Savings

- **User Story 4.1: Shared Ride Coordination**
 - **Description:** As a traveler arriving at a massive station, I want to coordinate a shared pickup so I don't have to navigate the taxi/didi queue alone.
 - **Acceptance Criteria:** Users at the same arrival station can view each other's status and messages to coordinate a shared ride.
- **User Story 4.2: Cost Comparison**
 - **Description:** As a solo traveler, I want to see the "solo cost vs. together price" for my trip so that I can see how much I save by sharing rides or rooms.
 - **Acceptance Criteria:** For a specific route or lodging option, the app displays a side-by-side price comparison for individual vs. group booking.
- **User Story 3.1: HSR Train Search**
 - **Acceptance Criteria:** User can search for a specific High-Speed Rail train number; results display correct departure times and seat availability.

2. Known Problems

Issues identified in the Test Plan report or during development.

- The Save & Skip button, upon itinerary generation, does not save the itineraries, nor does it skip the current recommendation and give a new recommendation
- The Next Train indicator on the home page does not show the actual next train

- Starting the App takes a considerable amount of time
 - The camera on Amap navigation auto-recenters to the user's location when the user drags away.
 - Map routing takes more time to load with more stops in between the current location to destination.
 - Auto zoom out for route overview doesn't work/ hasn't been tested
 - Itineraries generation for cultural landmarks/food and other aspects does not work; however, general itineraries generation for trains does suffice
 - The back button on some pages does not work, thus requiring the use of the navigation bar
 - Internaries generation sometimes requires rerunning [main.py](#) for it to work; no itineraries get generated
 - Upon itinerary generation, booking the itineraries does not work.
-

3. Product Backlog

High-priority items for the next development cycle.

Regional Cost Comparison

- **User Story:** As a regional traveler, I want to see how much I can get in one city versus another so that I can see what regions I should expect to spend more money in.
- **Priority:** High.

Multi-Language Support

- **Feature:** Translating all UI elements into two or more languages.
- **Languages:** Mainly Chinese (Traditional & Simplified) and English.

AI Itinerary Generator

- **Feature:** Utilizing Large Language Models (LLMs) to generate text descriptions for custom tours.

Expanded Transportation Integration

- **Feature:** Including various other transportation methods, such as airlines and Didi/taxi services.

Secure Payment Integration

- **User Story:** As a user ready to book, I want to open the specific booking page in WeChat so that I can pay securely with an international card already linked to WeChat Pay.
- **Priority:** Medium.

Offline Navigation

- **User Story:** As a traveler, I want my maps to work in "Offline Mode" so that I can navigate if I lose signal during the trip.
- **Priority:** Medium
